

DNR AIS Report to OIWG

November 13, 2018

Cedar Room, Jamestown S'Klallam Campus

County	Coordinator	Acres Treated	Rivermiles Surveyed / Treated	Crew Days	Value
Clallam	Cathy Lucero	128	--	12	\$15,000
Kitsap	Dana Coggon	6	6.25	7 (no crew July 4)	\$8,750
Mason	Pat Grover	23.21	3.8	11 (no crew July 4)	\$13,750
TOTAL		157.21	10.05	30	\$37,500

Lower Dungeness River Floodplain Restoration Project Area, Clallam County
Manual removal

Giant Hogweed Comparison and Identification

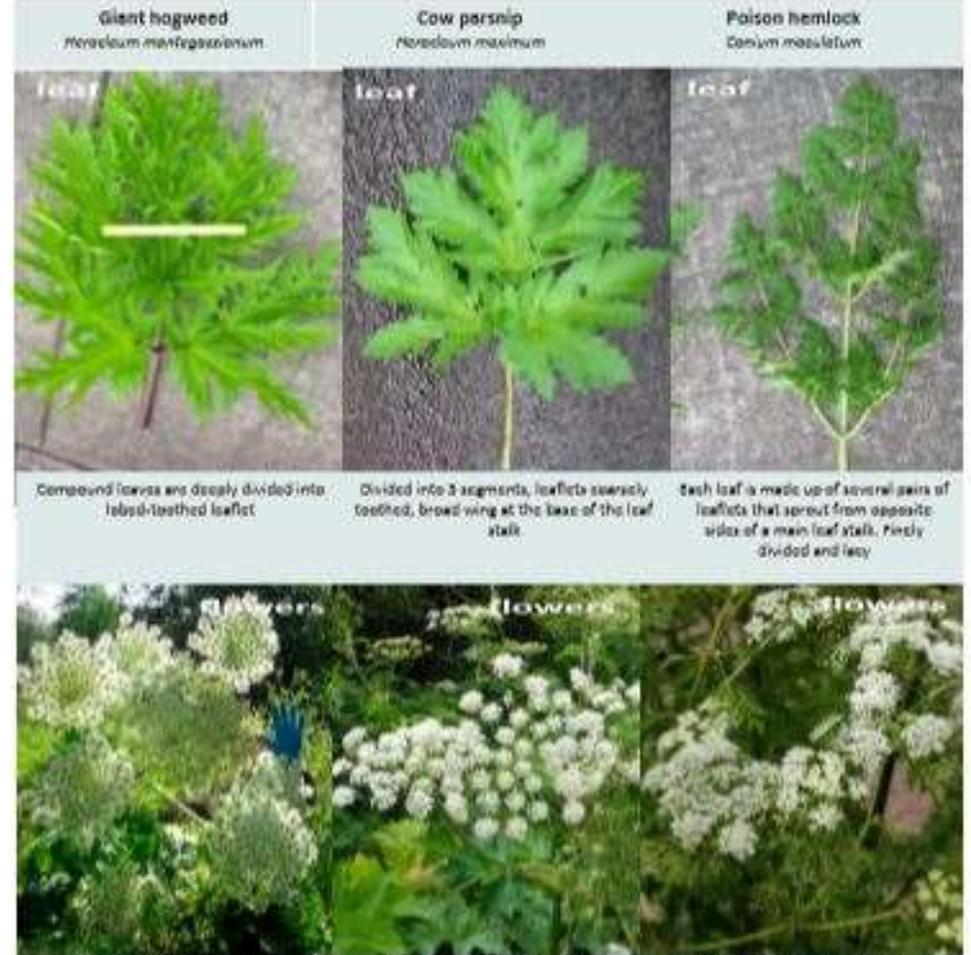

Page 1

Giant hogweed, *Heracleum mantegazzianum*, is a robust biennial or short-lived perennial of the carrot family. It is often confused with other common weeds and native plants in the carrot family. For example, cow parsnip, poison hemlock and wild carrot. The primary characteristics that distinguish giant hogweed are plant height, stem color, stem texture and leaf size. Giant hogweed can reach a mature height of 10-15 feet. The stem is often dark purple in color, but can vary from entirely purple to mostly green with purple blotches. A key-defining characteristic is the texture of the stem, which is rough and bumpy in appearance. The stem is covered with blistering stipules with individual hairs emerging from each bump. Leaf size of the mature plant can also help distinguish the plant, leaves are up to 3 feet in length. Other notable characteristics, flowers are large white compound umbels up to 2 feet across, compound leaves are deeply divided into lobed-toothed leaflets, and stems are hollow 2-4 inches in diameter.
